Product Safety Information

Safety Notice
Be sure that you are completely familiar with the safe operation of this equipment. This equipment may be connected to other machines that have rotating parts or parts that are controlled by this equipment. Improper use can cause serious or fatal injury. Always disconnect all electrical loads before starting or stopping the generator.

Installation and repair procedures require specialized skills with electrical generating equipment. Any person that installs or repairs this generator must have these specialized skills to ensure that this generating unit is safe to operate. Contact Baldor for repairs or for any questions you may have about the safe installation and operation of this system.

The precaution statements are general guidelines for the safe use and operation of this generator. It is not practical to list all unsafe conditions. Therefore, if you use a procedure that is not recommended in this manual, you must determine if it is safe for the operator and all personnel in the proximity to the generator and connected loads. If there is any question of the safety of a procedure please, contact Baldor before starting or stopping the generator.

This equipment contains high voltages. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the start-up procedure or troubleshoot this equipment.

This equipment may be connected to other machines that have rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt the start-up procedure or troubleshoot this equipment.

System documentation must be available to anyone that operates this equipment at all times.
Keep non-qualified personnel at a safe distance from this equipment.
Only qualified personnel familiar with the safe installation, operation and maintenance of this device should attempt start-up or operating procedures.
Always stop engine before making or removing any connections.
Always stop engine and allow it to cool before refueling.

Responsibility
When your generator is delivered, it becomes the responsibility of the owner/operator of the generator set to prevent unsafe conditions and operation of the equipment. Some responsibilities include (but are not limited to) the following:

1. It is the responsibility of the owner/operator of this generator to ensure that this equipment is correctly and safely installed.
2. It is the responsibility of the owner/operator of this generator to ensure that this equipment, when installed fully complies with all federal, state and local codes.
3. It is the responsibility of the owner/operator of this generator to ensure that any person operating this equipment has been properly trained.
4. It is the responsibility of the owner/operator of this generator to ensure that any person operating this equipment has access to all manuals and information required for the safe use and operation of this equipment.
5. It is the responsibility of the owner/operator of this generator to ensure that it is properly maintained and safety inspected at regular scheduled intervals.
6. It is the responsibility of the owner/operator of this generator to ensure that any person who has not been trained on the safe use of this equipment does not have access to this equipment.

Read This Manual Thoroughly
If you do not understand any concept, any procedure, any safety warning statement, any safety caution statement or any portion of this manual, contact Baldor or your nearest authorized Baldor representative. We are happy to make sure you understand the information in this manual so that you can safely enjoy the full use of this generator.
Precaution Statements Used In This Manual

There are three classifications of precautionary statements used in this manual. The most critical is a WARNING statement, then the Caution statement and the least critical is the Note statement. The usage of each statement is as follows:

**WARNING:** Indicates a potentially hazardous situation which, if not avoided, could result in injury or death.

**Caution:** Indicates a potentially hazardous situation which, if not avoided, could result in damage to property.

**Note:** Additional information that is not critical to the installation or operation.

**IMPORTANT SAFETY INSTRUCTIONS**

SAVE THESE INSTRUCTIONS – This manual contains important instructions for the generator that should be followed during installation, operation and maintenance of the generator. For ease of reading, the Warning statements are divided into four categories: Operation, Burn, Installation, and Maintenance.

**Operation**

**WARNING:** Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death. For storage or refueling handle fuel with care and only in clean, approved, properly marked safety fuel containers.

**WARNING:** Do not overfill the fuel tank. Only fill the tank to within 1/2 of the top of the tank to allow space for fuel expansion. Overfilling of tank may cause fuel to spill out onto engine and cause fire or explosion.

**WARNING:** Clean up fuel spills by wiping completely dry before starting engine. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.

**WARNING:** Make sure the fuel cap is completely and securely closed after refueling to prevent spillage. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.

**WARNING:** Never operate this generator in a manner other than as described in this manual. Operation in any manner not described in this manual should be considered unsafe and should not be attempted. Never start the engine unless you have first verified that the installation and operation of the generator are as described in this manual.

**WARNING:** Be sure that you are completely familiar with the safe operation of this equipment. This equipment may be connected to other machines that have rotating parts or parts that are controlled by this equipment. Improper use can cause serious or fatal injury.

**WARNING:** Exhaust fumes/gases are extremely dangerous and can cause severe illness or death. Never breathe exhaust fumes produced by a running engine. Only run the engine outdoors where ventilation is plentiful. Exhaust gases contain carbon monoxide, a colorless, odorless and extremely dangerous gas that can cause unconsciousness or death. Symptoms of carbon monoxide poisoning include: dizziness, nausea, headaches, sleepiness, vomiting or incoherence. If you or anyone else experiences these symptoms, get out into fresh air immediately. Stop the engine and do not restart the engine until it has been inspected and if necessary repaired or reinstalled in a well ventilated area.

**WARNING:** Hot exhaust gasses must never be directed toward anything that may catch fire or explode.

**WARNING:** This generator must not be used on or near any forest covered, brush covered, or grass covered land unless the engine’s exhaust system is equipped with a spark arrester. The spark arrester must be maintained in effective working order by the operator.

**WARNING:** Some parts of this generator rotate during operation. Rotating parts can present extreme danger if clothing or body extremities are caught by the rotating part and can cause serious or fatal injury. Never touch a part of the generator until the engine has been stopped and all rotating parts are completely stopped. Also, disconnect the battery terminals to prevent accidental engine rotation during servicing.

**WARNING:** Never move a generator set that is running. Loads should be connected and position secure before starting the engine. Hazards are caused by moving a generator set that is running.

Continued on next page.
Operation Warning Statements  Continued
WARNING: Be sure that you understand how to stop the engine quickly in case of an emergency situation. Become familiar with the controls and safety systems provided with this generator set.
WARNING: Always wear safety glasses with side shields and hearing protection when working near the generator.
WARNING: Improper operation may cause violent motion of connected equipment. Be certain that unexpected movement will not cause injury to personnel or damage to equipment.
WARNING: Never operate the generator set indoors or in a poorly ventilated area such as a tunnel or cave. Exhaust fumes are extremely dangerous to all personnel that are in or in contact with that area.
WARNING: Never permit anyone to operate the generator without proper instructions. Be sure to keep a copy of this manual with the generator so that all users can be properly informed of its safe operation.
WARNING: Never allow children or pets to be in the area where the generator is running. The generator and the equipment being powered by the generator may cause injury or death.
WARNING: Never operate the generator unless all guards, covers, shields and other safety items are properly installed.
WARNING: Do not put hands, feet, tools clothing or other objects near rotating parts such as drive shaft, pulley, belt etc. Rotating parts cause extremely dangerous situations because they can catch loose clothing or extremities and cause serious or fatal injury.
WARNING: When operating this generator remain alert at all times. Never operate machinery when physically or mentally fatigued, or while under the influence of alcohol, drugs or medication.
WARNING: Never operate the engine when the air cleaner is removed. An engine backfire can cause serious burns.
WARNING: Never “jump start” a generator to start the engine. If the battery charge is insufficient to start the engine, charge or replace the battery and try to restart. Jump starting a battery can cause the battery to explode and cause severe injury or death to anyone in the area.
WARNING: High voltage is present whenever engine is running. Electrical shock can cause serious or fatal injury. Never operate electrical equipment while standing in water, on wet ground or with wet hands, feet or shoes or while barefoot.
WARNING: High voltage is present whenever the engine is running. Electrical shock can cause serious or fatal injury. Always stop engine before connecting or disconnecting power cords or external devices.
WARNING: Do not smoke near generator during operation or while refueling. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.
WARNING: Stop engine and allow engine to cool before refueling. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.
WARNING: Never store the generator with fuel in the tank. Never store the generator indoors or in an enclosed area or in a poorly ventilated enclosure where fumes may reach an open flame, electrical spark or pilot light as on a furnace, water heater, clothes dryer, etc. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.
WARNING: Allow generator to cool before transporting it or storing it. Always drain fuel from tank after generator has cooled.
WARNING: When transporting the generator (especially over rough roads) always drain the fuel tank to prevent leakage or spillage of fuel. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.
WARNING: Operate the generator only on a level surface. If the generator is tilted during operation, fuel spillage may result. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death.
WARNING: Keep generator at least three feet away from buildings and other structures.
WARNING: Keep generator away from flammable or hazardous materials (trash, rags, lubricants, explosives, paints etc.) and grass or leaf build up.
WARNING: Keep a fire extinguisher near the generator while generator is in use. An extinguisher rated “ABC” by the National Fire Protection Association is appropriate.

Continued on next page.
**Warning Statements** Continued

**Burn**

**WARNING:** Parts of this generator are extremely hot during and after operation. To prevent severe burns, do not touch any part of the generator until you have first determined if the part is hot. Wear protective clothing and after use allow sufficient time for parts to cool before touching any part of the generator.

**WARNING:** Do not touch the hot exhaust parts of the engine. In addition to a severe burn, the sudden involuntary jerk of the hand or body part caused by contact with high voltage or a hot surface can result in injury to yourself or others.

**Installation**

**WARNING:** Installation and repair procedures requires specialized skills with electrical generating equipment and small engine systems. Any person that installs or performs repairs must have these specialized skills to ensure that the generator set is safe to operate. Contact Baldor for installation or repairs.

**WARNING:** Be sure all wiring complies with the National Electrical Code (NEC) and all regional and local codes or CE Compliance. Improper wiring may cause a hazardous condition and exposure to electrical hazards can cause serious injury or death.

**WARNING:** Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that grounds are connected. Electrical shock can cause serious or fatal injury. NEC requires that the frame and exposed conductive surfaces (metal parts) be connected to an approved earth ground. Local codes may also require proper grounding of generator systems.

**WARNING:** Place protective covers over all rotating parts such as drive shaft, pulley, belt etc. Rotating parts cause extremely dangerous situations because they can catch loose clothing or extremities and cause serious or fatal injury.

**WARNING:** Unauthorized modification of a generator set may make the unit unsafe for operation or may impair the operation of the unit. Never start a generator set that has been modified or tampered with. Be sure that all covers and guards are properly installed and that the unit is safe before starting the engine. If you are unsure, contact Baldor before starting the engine.

**WARNING:** When moving the generator, use reasonable caution. Be careful where you place fingers and toes to prevent injury “Pinch Points”. Never try to lift a generator without a hoist or lift means because they are heavy and bodily injury may result.

**WARNING:** When transporting a generator (especially if it has wheel option installed) secure the unit to prevent movement during transport.

**WARNING:** Never connect this generator to any buildings electrical system unless a licensed electrician has installed an approved transfer switch. The National Electrical Code (NEC) requires that connection of a generator to any electrical circuit normally powered by means of an electric utility must be connected by means of approved transfer switch equipment so as to isolate the electrical circuit from the utility distribution system when the generator is operating. Failure to isolate the electrical circuits by such means may result in injury or death to utility power workers due to backfeed of electrical energy onto the utility lines.

**WARNING:** Circuit overload protection must be provided in accordance with the National Electrical Code and local regulations.

**WARNING:** Check Ground Fault Circuit Interrupt (GFCI) receptacles monthly by using the “Test” and “Reset” buttons.

**WARNING:** Only a professional experienced technician should install a fuel supply system. Gasoline and diesel fuel are flammable and can cause fire, explosions, injury or death. Fuel supply lines should be kept away from sharp objects to prevent rupture. Comply with all NFPA regulations and local codes for shut–off valves, regulators, fuel line type etc.

**WARNING:** Have electrical circuits and wiring installed and checked by licensed electrician or qualified technician. Electrical shock can cause serious or fatal injury.

**WARNING:** Incorrect installation of this generator set could result in property damage, injury or death. Connection of the generator to its fuel source must be done by a qualified professional technician or contractor.

Continued on next page.
**Warning Statements** Continued

### Maintenance

**WARNING:** Before servicing the generator set, be sure to disconnect the battery terminals to prevent accidental engine rotation or starting.

**WARNING:** Before cleaning, inspecting, repairing, refueling or performing any maintenance to the generator set, always be sure the engine has stopped and that all rotating parts have also stopped. After stopping, certain components are still extremely hot so be careful not to get burned.

**WARNING:** Inspect all wiring frequently and replace any damaged, broken or frayed wiring or wires with damaged insulation immediately. Electrical shock can cause serious or fatal injury.

**WARNING:** Disconnect all electrical wires and load devices from generator power outlets before servicing the generator. Electrical shock can cause serious or fatal injury. Always treat electrical circuits as if they are energized.

**WARNING:** Check all fuel tanks, supply piping, and their connections monthly for fuel leaks. Diesel fuel is flammable and can cause fire, explosions, injury or death. If a leak is found, replace only with approved pipe or components.

**WARNING:** A battery presents a risk of fire and explosion because they generate hydrogen gas. Hydrogen gas is extremely explosive. Never jump start a battery, smoke in the area around the battery or cause any spark to occur in the area around the battery.

**WARNING:** Do not mutilate the battery or dispose of a battery in a fire. The battery is capable of exploding. If the battery explodes, electrolyte solution will be released in all directions. Battery electrolyte solution is caustic and can cause severe burns and blindness. If electrolyte contacts skin or eyes, immediately flush the area with water and seek medical attention quickly.

**WARNING:** A battery presents a risk of electrical shock hazard and high short circuit current. Electrical shock can cause serious or fatal injury. Never wear jewelry, watch or any metal objects when in the area around the battery.

**WARNING:** The battery electrolyte is a dilute sulfuric acid that is harmful to the skin and eyes. It is electrically conductive and corrosive. If electrolyte contacts the skin, flush the area immediately with water and wash it off using soap and water. If electrolyte contacts the eyes, immediately flush the eye thoroughly with water and seek medical attention quickly.

**WARNING:** The capacitor used in this generator can store and discharge a high voltage charge. Before working with or in the area of the capacitor, discharge the capacitor by shorting its leads together with a screwdriver with an insulated handle or insulated jumper wire.

**WARNING:** Be extremely careful when flashing the generator. When the alternator cover is removed rotating parts and high voltage are present. Electrical shock can cause serious or fatal injury. Rotating parts can present extreme danger if clothing or body extremities are caught by the rotating part and can cause serious or fatal injury.

**WARNING:** Never store an engine with fuel in its tank indoors or in an enclosed, poorly ventilated area where diesel fumes could reach an ignition source and cause an explosion.
Caution Statements

Caution: The brass connecting tab on some 120VAC duplex receptacles have been removed. Each receptacle is powered by a separate generator winding. When replacing a receptacle, inspect the brass tab that normally links both receptacles. If it is removed, be sure to remove the brass tab from the replacement receptacle before it is installed. Failure to remove the tab will cause a direct short to the generator windings and cause possible generator damage.

Caution: Avoid installing the generator set beside heat generating equipment, or directly below water or steam pipes or in the vicinity of corrosive substances or vapors, metal particles and dust. Heat can cause engine problems to develop and unwanted substances can cause rust or generator failure over time.

Caution: Do not apply high voltage to windings in a moisture-saturated condition. Moisture can cause insulation breakdown, making it necessary to return the generator to the factory for repair, and consequent expense and loss of time.

Caution: Use only original equipment or authorized replacement parts. Using the correct parts will assure continued safe operation as designed.

Caution: Do not support the generator from the top of the wrap frame.

Caution: Do not tamper with or change the engine speed. Engine speed is factory set to produce the correct voltage and output frequency.

Caution: Never operate the engine without a muffler. The engine is designed to have the correct exhaust components installed and operating without these components can present a fire hazard, cause excessive exhaust gases and cause damage to engine. Inspect muffler periodically and replace if necessary.

Caution: Operate the generator only on a level surface. Operation of the generator on an incline or slope may degrade engine lubrication and result in engine failure.

Caution: Always fill fuel tank with clean fresh fuel before use. Never leave fuel in tank for long storage periods. Old fuel becomes stale and can damage the fuel system causing the engine not to start. Always drain the fuel tank after use before storage.

Caution: For electric start models, do not place the key switch in the start position when engine is running. This causes the starting motor to engage and may damage the starter and engine.

Caution: This generator must have a battery installed for operation. The battery is used during starting and during operation. If engine operation is attempted while the battery is removed, damage to the engine’s electrical components may result.
Section 2
General Information

Thank you for purchasing your Baldor Generator Set. This manual contains information you need to safely and efficiently install and operate your generator set. During the preparation of this manual every effort was made to ensure the accuracy of its contents. This manual describes only very basic engine information. A separate owner’s manual for the engine is supplied with this unit for your use. Please refer to the engine manual for information relative to engine operation, maintenance, recommendations and additional safety warnings.

Copyright Baldor © 2004. All rights reserved.
This manual is copyrighted and all rights are reserved. This document may not, in whole or in part, be copied or reproduced in any form without the prior written consent of Baldor Electric Company, Inc.
Baldor Generators have earned the reputation of being high quality and dependable. We take pride in this fact and continue to keep our quality standards high on our list of priorities. We are also constantly researching new technological ideas to determine if they could be used to make our generator sets even better.
Baldor makes no representations or warranties with respect to the contents hereof and specifically disclaims any implied warranties of fitness for any particular purpose. The information in this document is subject to change without notice. Baldor assumes no responsibility for any errors that may appear in this document.

**Limited Warranty**

Baldor Generators will replace or repair free of charge any part or parts of the generator of their manufacture that are defective in workmanship and materials for a period of time as set forth in the Warranty Period chart below. All Baldor products requiring warranty service shall be transported or shipped freight pre-paid, at the risk of the party requiring warranty service, to a Baldor Generator repair facility, or to Baldor Generators’ Customer Service Department in Oshkosh, Wisconsin. Written notification of the alleged defect in addition to a description of the manner in which the Baldor generator is used, and the name, address and telephone number of the party requiring warranty service must be included. Baldor is not responsible for removal and shipment of the Baldor product to the service center or for the reinstallation of the Baldor product upon its return to the party requiring warranty service. Problems with Baldor products can be due to improper maintenance, faulty installation, non-Baldor additions or modifications, or other problems not due to defects in Baldor workmanship or materials. If a Baldor Generator repair facility determines that the problem with a Baldor product is not due to defects in Baldor workmanship or materials, then the party requesting warranty service will be responsible for the cost of any necessary repairs. EXCEPT FOR THE EXPRESSED WARRANTY SET FORTH ABOVE, BALDOR GENERATORS DISCLAIMS ALL OTHER EXPRESSED AND IMPLIED WARRANTIES INCLUDING THE IMPLIED WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE AND MERCHANTABILITY. NO OTHER WARRANTY, EXPRESSED OR IMPLIED, WHETHER OR NOT SIMILAR IN NATURE TO ANY OTHER WARRANTY PROVIDED HEREIN, SHALL EXIST WITH RESPECT TO THE GOODS SOLD UNDER THE PROVISIONS OF THESE TERMS AND CONDITIONS. ALL OTHER SUCH WARRANTIES ARE HEREBY EXPRESSLY WAIVED BY THE BUYER. UNDER NO CIRCUMSTANCES SHALL BALDOR GENERATORS BE LIABLE OR RESPONSIBLE IN ANY MANNER WHATSOEVER FOR ANY INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES, OR ANTICIPATED PROFITS RESULTING FROM THE DEFECT, REMOVAL, REINSTALLATION, SHIPMENT OR OTHERWISE. This is the sole warranty of Baldor Generators and no other affirmations or promises made by Baldor Generators shall be deemed to create an expressed or implied warranty. Baldor Generators has not authorized anyone to make any representations or warranties other than the warranty contained herein.

*For products covered under labor coverage, travel expenses will be allowed up to 7 hours straight labor or 300 miles, whichever occurs first and only applies to permanently wired and mounted products (AE, DLC, GLC, IDLC).
No warranty registration card is necessary to obtain warranty on Baldor Generators.
You must save the purchase receipt. Proof of purchase, date, serial number and model number will be required for all portable and Towable products to qualify for any warranty consideration.
For all other products, a start-up inspection form/warranty registration must be completed in its entirety and submitted to Baldor Generators within 30 days of start-up to qualify for any warranty consideration.

MN2414 General Information 2-1
Section 3
Receiving & Installation

Receiving & Inspection
When you receive your generator, there are several things you should do immediately.

1. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your system.
2. Verify that the part number of the system you received is the same as the part number listed on your purchase order.
3. If the system is to be stored for several weeks before use, be sure that it is stored in a location that conforms to published storage temperature and humidity specifications.

Lifting the Generator
When lift or hoist equipment is used to lift the generator and move it to position, be careful not to contact overhead wires or other obstacles. The generator weighs between 100 and 350 lbs. Use proper lift equipment and methods to avoid injury. Lift only by the tubular metal frame.

Figure 3-1 DG Series Generators

Storage
If you will not be using the generator set for a significant amount of time (3 months or longer) you should store the generator to prevent any problems that could arise from sitting idle. Please fully read the following guidelines prior to storing the unit.

1. Close all the fuel valves.
   Note: Do not let the fuel tank run completely empty. Unlike gas engines, diesel engines must be primed to remove air from the fuel lines.
2. Disconnect and remove the battery if your generator set is so equipped.
3. Drain the used oil from the engine’s crankcase and refill it with clean oil.
4. Provide maintenance to the engine and generator set as described in the engine and generator maintenance sections of this manual.
5. Cover any bare metal spots with paint or another type of rust preventative.

WARNING: Never store an engine with fuel in its tank indoors or in an enclosed, poorly ventilated area where diesel fumes could reach an ignition source and cause an explosion.
Physical Location

The mounting location of the system is important. It should be installed in an area that is protected from direct harmful gases or liquids, dust, metallic particles, shock and vibration. It can only be installed in an outdoor location so the exhaust fumes are vented to the atmosphere. This system must never be installed inside an enclosed building, home, shop or garage etc.

Several other factors should be carefully evaluated when selecting a location for installation:

1. For effective cooling and maintenance, the generator should be mounted on a flat, smooth, non-flammable level surface. A concrete pad is ideal and provides a secure installation.
2. The location for the generator must be dry. Never operate a generator in an area that has standing water or puddles.
3. Installation should prevent obstructions by buildup of leaves, grass, sand, snow, etc. It is important that the unit be operated in a reasonably clean environment.
4. All engines give off considerable heat when running. The engine in your generator set uses air to keep it cool so it is important that the ambient temperature is cool and does not exceed 100°F (even while it is running). Where natural ventilation is inadequate a fan to boost circulation should be used.
5. Exhaust Gases from internal combustion engines are extremely poisonous. Never operate an engine indoors.

**WARNING:** Exhaust fumes/gases are extremely dangerous and can cause severe illness or death. Never breath exhaust fumes produced by a running engine. Only run the engine outdoors where ventilation is plentiful. Exhaust gases contain carbon monoxide, a colorless, odorless and extremely dangerous gas that can cause unconsciousness or death. Symptoms of carbon monoxide poisoning include: dizziness, nausea, headaches, sleepiness, vomiting or incoherence. If you or anyone else experiences these symptoms, get out into fresh air immediately. Stop the engine and do not restart the engine until it has been inspected and if necessary repaired or reinstalled in a well ventilated area.

6. All electrical equipment should be protected from excessive moisture. Failure to do so will result in deterioration of the insulation and may result in short circuits and a possible electrocution hazard.

Installation

The generator is completely assembled, tested and adjusted at the factory before it is shipped to you. External connections required at the time of installation are:

- Note: The generator is shipped dry. This means no oil is in the engine crankcase and no battery is installed. You must refer to the engine manual and obtain the correct type and quantity of engine motor oil and the correct battery (if equipped for electric start).

1. Electrical Connections.
2. Ground Connection.

After installation, the post installation checks must be performed prior to starting the engine. After these checks have been performed and the system operation is verified to be good, refer to Section 6 Maintenance for periodic checks that must be performed at scheduled intervals to ensure continued operation with minimal problems.

Electrical Connections

All load connections are made at the panel using electrical cords with the proper mating plug for the receptacle being used. More than one receptacle can be used as long as the total load does not exceed the continuous rating of the generator.

**WARNING:** Never connect this generator to any buildings electrical system unless a licensed electrician has installed an approved transfer switch. The National Electrical Code (NEC) requires that connection of a generator to any electrical circuit normally powered by means of an electric utility must be connected by means of approved transfer switch equipment so as to isolate the electrical circuit from the utility distribution system when the generator is operating. Failure to isolate the electrical circuits by such means may result in injury or death to utility power workers due to backfeed of electrical energy onto the utility lines.

Use correct size insulated wire to connect the generator to the load. The gauge of the wire will depend on the distance to the load, the permissible voltage drop at the load, and the current required by the load. If you are not sure of the gauge wire needed for your application, consult a competent electrician. Using wire that is too small can result in fire hazard. Also, be sure the wire has the appropriate ratings for insulation and environment conditions.

The correct mating connector must be used to fit the connectors provided on the operator panel of your generator. Table 3-1 describes the connector types provided (receptacles) and the load characteristics to help you choose the correct size wire. Figure 3-2 shows the receptacles.

**Note:** GFCI is Ground Fault Protected power.

Class 1 wiring methods must be used for field wiring connections to terminals of a Class 2 circuit.

#### Figure 3-2 Receptacle Connections

![Receptacle Connections Diagram]

**Frame Ground Connection**

**WARNING:** Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that grounds are connected. Electrical shock can cause serious or fatal injury. NEC requires that the frame and exposed conductive surfaces (metal parts) be connected to an approved earth ground. Local codes may also require proper grounding of generator systems.

The NEC requires that the frame and exposed metal surfaces be at local ground reference potential to avoid electrical shock hazard. A local ground reference may require a driven earth ground conductor at the generator installation site. Make the ground connection as shown in Figure 3-3. Use the appropriate size wire (normally 6 AWG) as required by NEC and local codes. The local reference ground is normally a copper clad earth ground rod driven into the earth at least 8 feet.
Frame Ground Connection  Continued

**Engine Oil**
Refer to the engine manual that was provided with your generator. Determine the correct type of engine oil and the amount specified by the engine manufacturer. Add the required amount of oil to bring the oil level to full.

**Caution:** This generator must have a battery installed for operation. The battery is used during stating and during operation. If engine operation is attempted while the battery is removed, damage to the engine’s electrical components may result.

**Battery Connections**
The generator is shipped with no battery installed.

**WARNING:** Do not dispose of battery or batteries in a fire. The battery is capable of exploding. If the battery explodes, electrolyte solution will be released in all directions. Battery electrolyte solution is caustic and can cause severe burns and blindness. If electrolyte contacts skin or eyes, immediately flush the area with water and seek medical attention quickly.

**WARNING:** Do not mutilate the battery. The battery contains electrolyte solution which is caustic and can cause severe burns and blindness. If electrolyte contacts skin or eyes, immediately flush the area with water and seek medical attention quickly.

**WARNING:** A battery presents a risk of electrical shock hazard and high short circuit current. The following precautions are to be followed when working on batteries:
1. Remove watches, rings, necklaces and all other metal objects.
2. Use tools with insulated handles.
3. Wear rubber gloves and boots.

**WARNING:** The battery electrolyte is a dilute sulfuric acid that is harmful to the skin and eyes. It is electrically conductive and corrosive. The following precautions are to be followed when working on batteries:
1. Wear full eye protection (safety glasses or goggles) and protective clothing.
2. Where electrolyte contacts the skin, flush the area immediately with water and wash it off using soap and water.
3. Where electrolyte contacts the eyes, immediately flush the eye thoroughly with water and seek medical attention quickly.
4. Spilled electrolyte is to be washed down with an acid neutralizing agent. A common practice is to use a solution of one pound (500 grams) bicarbonate of soda to one gallon (four liters) of water. The bicarbonate solution is to be added until evidence of reaction (foaming) has ceased. The resulting liquid is to be flushed with water and the area dried.

**WARNING:** A battery presents a risk of fire because they generate hydrogen gas. Hydrogen gas is extremely explosive. Never jump start a battery, smoke in the area around the battery or cause any spark to occur in the area around the battery. The following precautions are to be followed when working on batteries:
1. Do not smoke when near batteries.
2. Do not cause flame or spark in battery area.
3. Discharge static electricity from body before touching batteries by first touching a grounded metal surface.
Battery Connections  Continued

Note: OHV units that have an electronic governor must have a battery installed before the
Genset can be started (even with the pull starter). If no battery is present or the battery is
discharged, the electronic governor will not operate and the generator set will not run.

Procedure: The correct type battery must be purchased and installed in the battery compartment provided.

1. Remove the bag containing the battery box components.
2. Set the battery on the battery tray.
3. Install the battery hold down rods as shown in Figure 3-4.
   a. Place the bent end of the battery hold down rod through the hole in the battery
      tray.
   b. Place the threaded end of the battery hold down rod through the hole in the
      battery hold down bar and secure with flat washer, lock washer and nut.
   c. Repeat steps a and b for the other battery hold down rod.
4. Connect the battery cables to the battery, be sure the Positive lead is connected to the
   positive (+) battery terminal and the negative lead is connected to the positive (−)
   battery terminal.

![Figure 3-4 Battery Installation](image_url)
The + and – terminals of your battery may be different than shown. Be sure that the Positive lead is connected to the positive (+) terminal of your battery.

Use of Electric Motor Loads

Electric motors require much more current (amperes) to start them than to keep them running.
Some motors, particularly split-phase motors are very difficult to start and require 5 to 7 times
more current to start them. Repulsion-induction type motors are the easiest to start and normally
only require 2 to 3 times as much current to start them.

Most fractional horsepower motors take about the same amount of current to start them and
keep them running. This is true whether they are the repulsion-induction type motor, capacitor
type motor, or the split-phase type motor.

Other factors that influence the amount of current needed to start a motor are:

1. **The type of load connected to the motor.** If the electric motor is connected to a hard
   starting load such as an air compressor it will require more starting current. If the same
   electric motor is connected to a light load such as a heater or power saw it will require
   less starting current.

2. **The brand or design of the electric motor.** The expected starting current for a
   particular size motor will vary depending on the brand of the electric motor as well as
   the type of electric motor (Split Phase, capacitor, Repulsion-induction type, etc.)

3. **The condition of the electric motor.** A clean motor with free turning bearings will
   require less starting currents than a similar type motor that is dirty and the bearings are
   not as free turning as they used to be.
**Optional Wheel Kit**  PDG2 – 2 Wheel Dolly Kit; and PDG4 – 4 Wheel Dolly Kit  
An optional 2 or 4 wheel dolly kit is available for these portable generators. If you have purchased one of these kits, refer to MN2409 for the installation instructions.

**Recommended Engine Oil and Battery Type**

Section 4
Operation

Operator Control Panel
Each operator panel is slightly different, depending on features of the generator you purchased. The Operator Control Panel of Figure 4-1 is shown because it has most of the available features. This will be used to explain how the controls operate.

Start Switch (not shown) Push to engage the engine starter (if Run Switch is in the ON position).

Run Switch (not shown) OFF – Turns off the engine (kill switch).
ON – Allows the engine to start and run for normal operation.
For DG3E, a Run/Stop lever is used where Run = On, Stop = Off.

Elapsed Time An hour meter that measures the total hours the generator has been in use (engine running).

AC Voltmeter Displays the voltage level at the output of the generator (the 230VAC output).

AC Circuit Breakers Provide overcurrent protection for the generator output. When tripped, the plunger (in center of breaker) will extend out about 3/8 inch. Remove the loads, push the plunger into the breaker to reset the breaker and restore the loads.

WARNING: Never connect this generator to any buildings electrical system unless a licensed electrician has installed an approved transfer switch. The National Electrical Code (NEC) requires that connection of a generator to any elastical circuit normally powered by means of an electric utility must be connected by means of approved transfer switch equipment so as to isolate the electrical circuit from the utility distribution system when the generator is operating. Failure to isolate the electrical circuits by such means may result in injury or death to utility power workers due to backfeed of electrical energy onto the utility lines.

Receptacles – Receptacles are provided to allow easy connection of electrical loads. Never connect this generator to any buildings electrical system unless a licensed electrician has installed an approved transfer switch. Multiple receptacles may be used at the same time provided the total electrical load does not exceed the generators rated output.

120 Volts – NEMA 5–20R GDCI Duplex receptacle provides ground fault protection. Rated 125VAC at 20 Amperes.

30 Amps 120 Volts – Twist lock NEMA L5–30R receptacle, rated 125 Volts at 30 Amperes.

30 Amps 120/240 Volts – Twist lock NEMA L14–30R receptacle rated 250 Volts at 30 Amperes.
Note: The nominal voltage produced by the generator at each receptacle is 120VAC or 240VAC.
Pre–Start Checks
Before the engine is started, several things must first be checked.

1. Place the generator set in an open, dry, well ventilated and reasonably level location.
2. If grounding is required for your application, check to make sure your unit is grounded properly (see Section 3).
3. Check the engine’s oil level and add oil if necessary to bring it to the level recommended by the engine manufacturer.
4. Check the fuel level and add fuel to within 1/2 inch of the fill tube if necessary.
5. Open the fuel valve on the fuel tank.
6. Check the fuel system for fuel leaks and repair them prior to starting the engine. Wipe up any fuel spills before starting the engine.
7. Disconnect or “turn off” all external loads.
8. Make sure all circuit breakers are set (pushed in).
9. Tighten any bolts or nuts that may have loosened due to vibration.
10. Be sure all extension cords are in good condition before starting the generator.

Start-Up Procedure
Electric Start

1. Move the engine’s choke lever to the “Choke/Start” position. If the engine is warm or if the ambient air temperature is high; try starting the engine without choking it.
2. Move the RUN “ON/OFF” switch to “ON” (if equipped).
   For DG3E, put the Run/Stop lever in the Run position).
3. Press the Start Switch to engage the electric start motor.
4. Do not allow the starter motor to crank for more than 10 seconds at a time.
5. Allow 20 seconds between starter motor cranking attempts.
6. Once the engine has started, release the start switch and do not re–engage it.

**Note:** If the engine does not start after a few attempts, smell for fuel near the air cleaner. If there is a significant fuel smell, turn the choke lever off and attempt to start the engine.

7. When the engine starts, turn the engine's choke lever to the “OFF” position.
8. Power is now present at the receptacles.
   Connect or “turn on” the loads you wish to operate.

Stopping Procedure

1. Disconnect or “Turn Off” all loads connected to the generator set.
2. Move the RUN “ON/OFF” switch to “OFF” (if equipped).
   For DG3E, put the Run/Stop lever in the STOP position).
3. Turn all fuel valves off.
This manual contains only very minimal engine maintenance instructions. Refer to the engine manufacturer’s owner’s manual for specific engine maintenance instructions for your generator set. Any maintenance instructions or recommendations in the engine owner’s manual take precedence over any of the following general recommendations.

**General:**

1. Inspect the fuel system for leaks. Replace all defective components immediately.
2. Inspect and replace any fuel line that shows signs of deterioration.
3. Inspect all fuel clamps to ensure they are tight.
4. Make sure the fuel cap fits snugly on the fuel tank and that the fuel tank does not leak.
5. Inspect and clean the battery posts and the associated battery cable terminals.
6. Inspect the external wire cables and connectors used with the generator set for cuts, frayed insulation, or loose connections. Repair or replace damaged parts before use.
7. The engine should be checked for proper speed setting(s).
   a. Disconnect all electrical loads and start the engine.
   b. Adjust the engine speed to 3720 RPM (62 Hz) with no load speed.
   c. Adjust the auto idler speed after you have accomplished the above adjustment.
   d. Adjust the auto idler speed by moving the electro-magnet back and forth in the magnet bracket to achieve an engine RPM of 2500–2900 with the auto idler switch “ON”.
8. Test all GFCI receptacles monthly by pressing the test button on the receptacle and making sure that the GFCI trips and and no voltage is present at the receptacle. Replace any GFCI receptacle that fails the test.

**Engine:**

1. Clean and/or replace any fuel, oil, and/or air filters per the engine manufacturers’ guidelines.
2. Check oil level regularly; at least every 5 to 8 operating hours. Maintain the proper oil level.
3. Change the oil as is recommended in the engine manufacturer’s owner’s manual.
4. Clean the cooling fins on the engine to keep the engine’s heat dissipation potential at it’s maximum.
5. Inspect and clean all governor linkages so they operate properly.

**Alternator:** (also called Generator End)

This generator set must be run at its proper speed to obtain the correct electrical power at its output. All engines have a tendency to slow down when a load is applied to it. The engine governor is designed to hold the operating speed as nearly constant as possible. When the electrical load is increased, the engine is more heavily loaded and engine speed drops slightly. This slight decrease in engine speed results in a slight decrease in generator voltage and frequency output. This voltage and frequency variation has no appreciable effect in the operation of motors, lights, and most appliances and tools. However, timing devices and clocks will not keep perfect time when used on this generator.

1. Clean the generator set and remove any and all dust, dirt, or other foreign material.
2. Inspect and clean the cooling air intake and exhaust louvers of the generator end.
   Make sure they are clean. Remove dirt or any buildup that may restrict the cooling air flow.
3. Clean the generator set and its components with a damp cloth or sponge.
   Never use a water hose or pressure washer as this may damage electrical components.
4. Inspect and replace any control panel components that are broken or not working properly (receptacles, circuit breakers, switches, etc.)
### Troubleshooting Guide

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine will not start</td>
<td>No fuel. Restricted air flow.</td>
<td>Check that fuel valves are ON. Check fuel level in fuel tank. Check/replace air filter. Check that engine switch is in Start position.</td>
</tr>
<tr>
<td>Engine not crank (electric start)</td>
<td>Dead battery.</td>
<td>Remove battery and trickle charge or replace with new battery. Never Jump Start.</td>
</tr>
<tr>
<td>Engine starts but not run smoothly</td>
<td>Fuel or ignition problem</td>
<td>Refer to engine manual.</td>
</tr>
<tr>
<td>Engine overheats</td>
<td>Excessive load Debris or dirt buildup on engine</td>
<td>Remove one or more electrical loads. Remove debris. Clean engine surfaces to allow cooling.</td>
</tr>
<tr>
<td>No output voltage</td>
<td>Circuit Breaker tripped or defective. Loss of residual magnetism in exciter field poles. Open in stator windings Defective exciter circuit.</td>
<td>Reset circuit breaker or replace if required. Flash field. Check for continuity in windings. Return to factory for repair if open. Check/replace diode and capacitor and flash the field.</td>
</tr>
<tr>
<td>Output voltage varies</td>
<td>Irregular speed (fixed speed mode) Fluctuating speed (fixed speed mode) Loose terminal or load connections Defective bearing (uneven air gap)</td>
<td>Check engine for malfunction or load for fluctuation Stabilize load. The addition of a lamp load (resistance load) may compensate partially for load changes caused by intermittent motor operation. Do not overload. Verify all connections are proper and check tightness torque of terminals. Replace worn bearing</td>
</tr>
<tr>
<td>Low output voltage</td>
<td>Low engine speed Excessive load High resistance connections - connections will be warm or hot Shorted field Low power factor</td>
<td>Check that the Auto Idle switch is in OFF position. Check engine for malfunction or system for overload. Reduce load. Verify all connections are proper and check tightness torque of terminals. Test field coils for possible short by checking resistance with an ohmmeter or resistancebridge. Return rotor assembly to factory for repair if alternator field coils are shorted. Reduce inductive (motor) load. Some AC motors use about the same current regardless of load. Do not use motors of greater horsepower rating than is necessary to move the mechanical load.</td>
</tr>
<tr>
<td>High output voltage</td>
<td>Excessive speed (fixed speed mode)</td>
<td>Check engine for malfunction</td>
</tr>
<tr>
<td>Electrical shock when frame is touched</td>
<td>Static charge. Grounded armature or field coil.</td>
<td>Ground generator frame at local reference ground (see Section 3). Return to factory for repair</td>
</tr>
<tr>
<td>Mechanical noise</td>
<td>Defective bearing Rotor rubbing on stator Loose or misaligned coupling</td>
<td>Replace bearing Bad bearing - replace. Bent shaft - return to factory. Loose end bell - tighten; Loose drive Discs - tighten Tighten; align coupling and alternator shaft to engine shaft.</td>
</tr>
</tbody>
</table>

### Service

Service for your generator can be obtained from Baldor Generators. Please have the following information available prior to contacting the factory:
- The model number and serial number of the generator set.
- A complete and accurate description of the problem.

### Parts

Parts for your generator can be obtained from Baldor Generators. Please have the following information available prior to contacting the factory:
- The model number and serial number of the generator set.
- A complete and accurate description of the part (part number if known).

Note: Engine parts can usually be obtained from a local distributor by using the information in the engine manufacturer's owner's manual.
Caution: The brass connecting tab on some 120VAC duplex receptacles have been removed. Each receptacle is powered by a separate generator winding. When replacing a receptacle, inspect the brass tab that normally links both receptacles. If it is removed, be sure to remove the brass tab from the replacement receptacle before it is installed. Failure to remove the tab will cause a direct short to the generator windings and cause possible generator damage.

Operator Panel Configuration

**AC Voltmeter.**
This voltmeter displays the voltage level being produced by the generator set.

**AC Circuit Breakers.**
Provide overload protection for the generator set.

**120 Volts**  NEMA 5−15R GFCI Receptacle.
This ground fault circuit interrupter duplex receptacle is rated at 125VAC, 15 Amps.

**120 Volts**  NEMA L5−30R Receptacle.
Twist-lock style receptacle rated for 125VAC, 30 Amps.

**120/240 Volts**  NEMA L14−30R Receptacle.
Twist-lock style receptacle rated for 125/250VAC, 30 Amps.
Replacement Parts

Replacement parts assembly views for the Generator set are shown in Figure A-3 and A-4. Parts information is provided in Table A-1. Parts information for the engine is provided in the engine manual that was provided with your generator set. Please refer to the engine manual for replacement parts information.
