

ADDENDUM

For installs in areas that frequently see freezing temperatures, we recommend the following options:

- 1) Only fill the QwikPad® for **Generators** to 80% full for increased lifetime in freezing temperatures. This can be done by filling the pad with water to a depth of 3 inches. Filling the pad at 80% meets wind load ratings of 125mph.
- 2) Install the QwikPad® for **Generators** completely empty if wind ratings are not a concern.
- 3) Optional soil/concrete anchors can be applied in option 1 or 2, if so desired by the user.
